

1. Normalize the images

**2. Sample random
diffusion times**
the full spectrum, 0 to 1

**3. Compute noise rates
and signal rates**
from the schedule

4. Add noise
 $\text{signal} * \text{image} + \text{noise} * \text{mask}$

5. Denoise

Loss = mean absolute error
between the **real** noise
mask
and the **predicted** one
